

Issue	Assignee(s)	Estimated time	Actual time	Completion status	Notes
#4: Pre-process text	Stefan Bud	3h	4h	Done	Got used to the PDF box library Needs further research for testing some of the methods
#5: Annotation database	Paul Stan	2h	4h	Done	Majority of the time was spent trying to figure out how to add the right dependencies for mysql. Still need to get approval for an actual database that is not hosted locally
#6: Frontend, first design	Rebecca Andrei	3h	3h	Done	This is only the design for scenario 1, not the final project design. It was made so we could link the backend functionality to something the client could use. As a note, the frontend depends A LOT on Brightspace integration, since the university's Brightspace page definitely has its own styles / formats we have to abide by.
#7: Pipeline	Calin Georgescu	2 hours	3 hours	Done	Spent most of the time finding a docker with all the necessary libraries for the pipeline to run
#8: Link frontend to backend	Radu Vasile	3 hours	2.5 hours	Done	Spent most of the time figuring out how to create a file without saving it locally, on disk.
#9: Checkstyle	Calin Georgescu	2 hours	2 hours	Done	Spent most of the time talking to teammates and deciding on rules

- What worked well:
 - PDFBox documentation is extensive, therefore it was easy to get accustomed at a first glance
 - The issues divided for this week were mostly for setup, therefore the work process was pretty smooth
- What difficulties we encountered:

- The pipeline posed some difficulties due to our lack of experience with it, therefore it took many attempts before getting it right
 - Some information regarding PDFBox is outdated, therefore we need to be careful when conducting research.
- What should we adjust for the next sprint:
 - The workload was quite small, therefore we should start working on more complicated features
 - Little testing was done, therefore we should focus on testing as well.
